Sequence – MiniZinc

- Define a MiniZinc model which takes a integer n defining the length of an array of numbers x taking values from 0 to 3, e.g., x = [0, 1, 2, 0, 3] for n = 5.
- Constrain the numbers so that
  - the first number is zero,
  - the last number is 3,
  - the sum of any two adjacent numbers in the array x is at most 3, and
  - the value of x at positions divisible by 3 to be greater than or equal to 2.
- Maximize the sum of the numbers in the array x.
- The output should be of the form
  - sum = array of values, e.g.,
  - 5 = [0, 0, 2, 0, 3]
  - 6 = [0, 1, 2, 0, 3]
